

# AUTOMATED WEATHER WARNING

Protect residents with automatic notifications delivered by CodeRED Weather Warning. When severe weather strikes, seconds can make a difference in how residents prepare and respond.

## Automated messages

CodeRED Weather Warnings are launched just moments after a bulletin has been issued by the National Weather Service (NWS) with no staff action required. This sophisticated feature of the CodeRED system takes pressure off of internal resources while continually ensuring citizens and staff threatened by local severe weather are notified and remain informed.

## National Weather Service Polygon Methodology

Utilizing information provided by NWS to define a storm's direction and speed, CodeRED Weather Warning geographically targets notifications to reach only those in the projected path of the storm - increasing relevance and reducing false alarms.

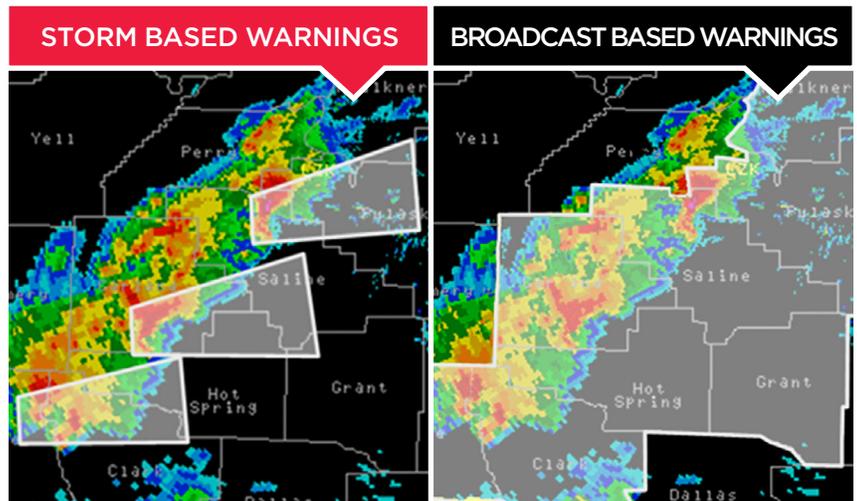

## Types of warnings issued:

- Severe thunderstorms
- Flash floods
- Tornadoes
- Winter storms\*
- Tsunamis\*

\*Available to only those areas prone to these weather conditions

## Flexible Enrollment Options

Residents may select which types of weather alerts they wish to receive.

“We had a tornado go through our city and CodeRED Weather Warning helped our citizens with early notification. Fortunately we didn't have any fatalities, but 300 homes were completely destroyed. CodeRED Weather Warning gave our residents early warning with extra time to prepare.”

 Thomas Griffith, Fire Chief - City of Lancaster, TX
